

# Keep It Simple<sup>®</sup> (KIS) Soluble Seaweed Extract Powder

## DESCRIPTION FOR USE:

Whenever possible, the total dosage should be applied in several smaller-dose applications, rather than one large application. Do not spray or irrigate more than once every 7 days. It may be applied by itself or as an additive with most companion materials offered at [compostjunkie.com](http://compostjunkie.com).

The powder may be diluted in any volume of water; however, it is recommended that enough water be used to ensure complete leaf coverage. The addition of biodegradable surfactant (e.g. small amount of vegetable oil) is recommended for maximum dispersal and leaf adherence.

KIS soluble seaweed extract powder should be used at the rate of 24-48 dry ounces per acre per year for turf, crops, and plants. A minimum of 3 applications per year are recommended, but more frequent applications are preferable. Do not exceed 12 dry ounces of powder per acre in any one application.

To calculate the amount to use in each application, take the total amount of seaweed to be used per acre per season or crop cycle (24 to 48 dry ounces), and divide it by the total number of foliar or irrigation applications intended to be made during the season.

For smaller areas or for spot spraying, add 1.5 teaspoons of powder per gallon of water or 1 dry ounce of powder per 10 gallons of water and spray plants to the point of run-off.

If you have any additional questions or concerns, please contact Dave by email at [info@compostjunkie.com](mailto:info@compostjunkie.com).
